18/10/2021

Dear Robert,

Re: Ms Ashleigh Kathleen Keeling
09/08/1985
59/17 Medley Street Chifley 2606
Ph:
Mob: 0412142201

As per your request I would like to organise serial prolactin levels for Ash to rule out stress induced hyperprolactinaemia in the context of a likely pituitary microadenoma demonstrated on MRI.

For your reception team: please CC the serial prolactin results to Dr Schmidli's private rooms as well.

Thankyou for seeing Ashleigh, a 36 yrs f with high prolactin and recurrent intermittent unexplained flushing with MRI showing <2mm pituitary adenoma. I have faxed the MRI to your offices as well.

Her main concerns are:

1. fertility preservation (aiming to freeze later this year if possible)
2. could this microadenoma explain her flushing and does this need further investigation
3. could this microadenoma be contributing to severe premenstrual dysphoria exacerbating post traumatic stress disorder being managed by psychological therapy and SSRIs.

She is currently undergoing investigations for fertility preservation in Melbourne.

Past History:

27/02/2012 CIN 1
PTSD
premenstrual dysphoric disorder

Current Medication:

Sertraline 50mg Tablet ½ Daily increasing to max 100mg daily if required over 6 weeks
Iron - ferrograd c daily
vitamin D - 2000iu
Plus fertility supplements and prenatal vitamins
melatonin 5mg

Allergies:

Nil known.

Other details:

Mother: Cholesterol
Father : prostate cancer
Type 2 diabetes

HORMONE ASSAYS

Date 10/05/21
 Time 0745
 Lab No. 941312061 Units Range

Prolactin	532	mIU/L	(<480)
Mono Prolactin	414	mIU/L	
Macroprolactin	138	mIU/L	

PROLACTIN ELEVATED.

Causes of elevated prolactin include stress, medication e.g. Risperidone, or pituitary pathology for which further investigation may be indicated. Macroprolactin was not detected in significant levels. i.e. this high result is unrelated to prolactin binding to a large protein, usually immunoglobulin. This raised total prolactin may therefore be significant.

Dr Paul Whiting, Pathologist, ph 02 62859895.

12:53

Test: Testosterone Free Level

	<LATEST>		
Date	31/08/21		
Time	07:45		
SHEG	57.7	nmol/L	
Testosterone Level	1.1	nmol/L	
Calc Free Testostero	15	pmol/L	(0-30)
Free Testosterone No Sent to RPAH			

Result Comments:

SHEG 31/08/21 07:45
SHEG

Effective of 10.3.2020, Roche has re-standardised its Sex Hormone Binding Globulin (SHEG) method against an international reference material which results in an approximate 18% decrease in patient results. The Free Androgen Index (FAI) in females and calculated Free Testosterone (cFT) in males and females may be affected by this change. Please interpret results accordingly. If you need further i

Reference intervals:

Males: 14 - 75 nmol/L
Females (Non-Pregnant): 20 - 120 nmol/L
Females (Follicular Phase): 27 - 120 nmol/L
Females (Mid-Cycle): 12 - 100 nmol/L
Females (Luteal Phase): 29 - 120 nmol/L
Females (On oral contraceptive): 59 - 167 nmol/L
Females (Postmenopausal): 21 - 149 nmol/L
Females (Hirsute): 21 - 89 nmol/L
Females (1st Trimester Pregnancy): 27 - 250 nmol/L
Females (2nd, 3rd Trimesters Pregnancy): 90 - 520 nmol/L

Testosterone Level 31/08/21 07:45

Reference intervals:

Female premenopause: < 1.8 nmol/L
Female postmenopause: < 1.5 nmol/L

Reference intervals apply to morning samples. Serum Testosterone is subject to circadian rhythm, with values falling by 20 - 30% from morning to afternoon.

Calc Free Testosterone 31/08/21 07:45
Testosterone Free Calculated.

A low Calculated Free Testosterone (CFTES) or Free Androgen Index (FAI) does not make a diagnosis of testosterone or androgen deficiency.

The FAI in men does not add useful information and will no longer be calculated or reported (men only).

Free Testosterone Note 31/08/21 07:45
Specimen sent to Royal Prince Alfred Hospital.
